**WEED IDENTIFICATION GUIDE**

**American Burndown**  
*Enicochloa frumentacea* (American Burndown) is a weed that often grows in areas that are dry and sandy. Its leaves are long and narrow, and its seed heads are flat and cylindrical. It can be found throughout the Eastern United States, western North America, and Alaska.

**Clumpsy Nye**  
*Cynodon dactylon* (Lawns) is a warm-season perennial that is often found in lawns. Its leaves are broad and flat, and it has a creeping root system. It can be identified by its low height and its ability to spread rapidly. It is common in the Southeastern United States.

**Annual Leopards**  
*Cynodon dactylon* (Annual Leopards) is a warm-season perennial that is often found in lawns. Its leaves are broad and flat, and it has a creeping root system. It can be identified by its low height and its ability to spread rapidly. It is common in the Southeastern United States.

**Dallgrass**  
*Axonopus affinis* (Dallgrass) is a bunchgrass that is often found in lawns. It has long, narrow leaves and a creeping root system. It can be identified by its low height and its ability to spread rapidly. It is common in the Southeastern United States.

**Black Medics**  
*Medicago bracteata* (Black Medics) is a cool-season perennial that is often found in lawns. Its leaves are broad and flat, and it has a creeping root system. It can be identified by its low height and its ability to spread rapidly. It is common in the Northeastern United States.

**Creeping Beggartweed**  
*Southwoldia emoryi* (Creeping Beggartweed) is a summer annual with very fine, thread-like stems. It can be found in lawns and along roadsides. It is common in the Southeastern United States.

**African Chestnut**  
*Celtis africana* (African Chestnut) is a chestnut tree that is often found in lawns. Its leaves are broad and flat, and it has a creeping root system. It can be identified by its low height and its ability to spread rapidly. It is common in the Southeastern United States.

**Goldenrod (Solidago)**  
*Solidago canadensis* (Goldenrod) is a daisy-like flower that grows in lawns. Its leaves are broad and flat, and it has a creeping root system. It can be identified by its low height and its ability to spread rapidly. It is common in the Northeastern United States.

**Dowserweed**  
*Houttuynia cordata* (Dowserweed) is a daisy-like flower that grows in lawns. Its leaves are broad and flat, and it has a creeping root system. It can be identified by its low height and its ability to spread rapidly. It is common in the Southeastern United States.

**Goosegrass**  
*Echinochloa crus-galli* (Goosegrass) is a daisy-like flower that grows in lawns. Its leaves are broad and flat, and it has a creeping root system. It can be identified by its low height and its ability to spread rapidly. It is common in the Northeastern United States.

**Gopherfoot Lovegrass**  
*Echinochloa colona* (Gopherfoot Lovegrass) is a daisy-like flower that grows in lawns. Its leaves are broad and flat, and it has a creeping root system. It can be identified by its low height and its ability to spread rapidly. It is common in the Southeastern United States.

**Kyllinga Green**  
*Kyllinga brevifolia* (Kyllinga Green) is a daisy-like flower that grows in lawns. Its leaves are broad and flat, and it has a creeping root system. It can be identified by its low height and its ability to spread rapidly. It is common in the Southeastern United States.

**Poa annua**  
*Poa annua* (Poa annua) is a low-growing grass that is often found in lawns. Its leaves are broad and flat, and it has a creeping root system. It can be identified by its low height and its ability to spread rapidly. It is common in the Northeastern United States.

**Corn Speedwell**  
* Veronica arvensis* (Corn Speedwell) is a winter annual with very fine, thread-like stems. It can be found in lawns and along roadsides. It is common in the Southeastern United States.

**Prostrate KNOTWEED**  
*Rheum palmatum* (Prostrate KNOTWEED) is a daisy-like flower that grows in lawns. Its leaves are broad and flat, and it has a creeping root system. It can be identified by its low height and its ability to spread rapidly. It is common in the Southeastern United States.

**Purple Cudweed**  
*Chrysanthemum leucanthemum* (Purple Cudweed) is a daisy-like flower that grows in lawns. Its leaves are broad and flat, and it has a creeping root system. It can be identified by its low height and its ability to spread rapidly. It is common in the Southeastern United States.

**Dallisgrass**  
*Axonopus affinis* (Dallisgrass) is a bunchgrass that is often found in lawns. It has long, narrow leaves and a creeping root system. It can be identified by its low height and its ability to spread rapidly. It is common in the Southeastern United States.

**Florida Pusley**  
*Nymphoides cordata* (Florida Pusley) is a daisy-like flower that grows in lawns. Its leaves are broad and flat, and it has a creeping root system. It can be identified by its low height and its ability to spread rapidly. It is common in the Southeastern United States.

**Spurge, Garden**  
*Chenopodium berlandieri* (Garden Spurge) is a daisy-like flower that grows in lawns. Its leaves are broad and flat, and it has a creeping root system. It can be identified by its low height and its ability to spread rapidly. It is common in the Northeastern United States.

**Shiny Cudweed**  
*Chrysanthemum leucanthemum* (Shiny Cudweed) is a daisy-like flower that grows in lawns. Its leaves are broad and flat, and it has a creeping root system. It can be identified by its low height and its ability to spread rapidly. It is common in the Southeastern United States.

**Yellow Woodsorrel**  
*Oxalis stricta* (Yellow Woodsorrel) is a daisy-like flower that grows in lawns. Its leaves are broad and flat, and it has a creeping root system. It can be identified by its low height and its ability to spread rapidly. It is common in the Southeastern United States.

**Virginia Butterweed**  
*Bidens frondosa* (Virginia Butterweed) is a daisy-like flower that grows in lawns. Its leaves are broad and flat, and it has a creeping root system. It can be identified by its low height and its ability to spread rapidly. It is common in the Southeastern United States.

**Rescuegrass**  
*Cyperus rotundus* (Rescuegrass) is a daisy-like flower that grows in lawns. Its leaves are broad and flat, and it has a creeping root system. It can be identified by its low height and its ability to spread rapidly. It is common in the Southeastern United States.
